- Introduction
- Ideals in rings
- Radicals in rings
- Radicals in modules

Introduction

A brief history

- Van der Waerden (1930): study splitting algorithm of “explicitly given” fields.
- Church (1936), Kleene(1936), Turing(1937): provide formal definition of algorithm (i.e., finite procedure).
- Fröhlich and Shepherdson (1956): provide formal definition of explicit fields,
 - construct an explicit field with no splitting algorithm.
- Rabin (1960): study subgroups of computable groups, algebraic closures of computable fields,
 - every computable field has a computable algebraic closure.

- Computable functions (or sets): Turing computable, intuitive computable.
- Partial computable functions: $\varphi_0, \varphi_1, \dots, \varphi_e, \dots$.
- Computationally enumerable sets ($=\Sigma_1^0$ sets): $W_0, W_1, \dots, W_e, \dots$.
 - $\emptyset' = \{e : \varphi_e(e) \downarrow\}$ (i.e., the Halting set) is Σ_1^0 -complete.
 - $\text{Fin} = \{e : |W_e| < \infty\}$ is Σ_2^0 -complete.
 - $\text{Inf} = \{e : |W_e| = \infty\}$ is Π_2^0 -complete.
- Computationally enumerable trees: $T_0, T_1, \dots, T_e, \dots$
- $\text{WF} = \{e : T_e \text{ is well-founded computable tree}\}$ is Π_1^1 -complete.

Turing reducibility

- (1) \leq_T : Turing reducibility on subsets of \mathbb{N} .
- (2) \equiv_T : Turing equivalence relation.
- (3) Turing degrees (or degrees): equivalence classes of \equiv_T .
 - $\mathbf{0}$: the degree of computable sets;
 - $\mathbf{0}'$: the degree of Halting problem.
- (4) c.e. degrees.
- (5) PA degrees.
 - A set is PA if it can compute an infinite path of any infinite computable binary tree.

Subsystems of second order arithmetic

RCA_0 : the base system that captures effective proofs.

- $RCA_0 \vdash$ “every field has an **algebraic closure**”.

WKL_0 : $RCA_0 +$ “for any X , there is a set Y that is of PA degree relative to X ”.

ACA_0 : $RCA_0 +$ “for any X , the Halting set X' relative to X exists”.

Ideals in rings

Computable ring

A **computable ring** is a computable set $R \subseteq \mathbb{N}$ together with computable binary operations $+_R$ and \cdot_R on R and elements $0_R, 1_R$ in R such that $(R, +_R, \cdot_R, 0_R, 1_R)$ satisfies axioms of a ring.

Examples:

- $\mathbb{Z}[x_1, x_2, \dots, x_n], \mathbb{Q}[x_1, x_2, \dots]$.

The ideal membership problem

Given a computable ring R , how about the complexity of its:

- maximal ideals, prime ideals, finitely generated ideals, or even general ideals...

Friedman, Simpson, Smith (1983): **Countable algebra and set existence axioms**, *Ann. Pure Appl. Logic*.

Theorem(FSS, 1983)

Over RCA_0 , the following are equivalent.

- (1) WKL_0 .
- (2) Any commutative ring contains a **prime ideal**.

Theorem(FSS, 1983)

Over RCA_0 , the following are equivalent.

- (1) ACA_0 .
- (2) Any commutative ring contains a **maximal ideal**.

Downey, Lempp, Mileti (2007): [Ideals in computable rings](#), *J. Algebra*.

Theorem(DLM, 2007)

Over RCA_0 , the following are equivalent.

- (1) WKL_0 .
- (2) Any commutative ring that is not a field has a [nontrivial ideal](#).

Theorem (DLM, 2007)

The following are equivalent over RCA_0 .

- (1) ACA_0 .
- (2) Any commutative ring that is not a field has a [nontrivial finitely generated ideal](#).

- A commutative ring containing **no infinite ascending chain** of ideals is called Noetherian.
- A commutative ring containing **no infinite descending chain** of ideals is called Artinian.

Theorem(Conidis, 2010)

There is a computable ring R containing an infinite **uniformly computable increasing** sequence $I_0 \subset I_1 \subset \dots$ of ideals such that

- (1) every ideal $I \subseteq R$ that is **not PA** is **computable**, and it is equal to I_n for some $n \in \mathbb{N}$ or $I_\infty = \bigcup_{i \in \mathbb{N}} I_i$;
- (2) every infinite **decreasing** sequence $J_0 \supset J_1 \supset \dots$ of ideals in R contains some J_n that is of **PA** degree.

Theorem

- Conidis (2010): over RCA_0 , “every Artinian ring is Noetherian” proves WKL_0 .
- Conidis (2013): WKL_0 proves “every Artinian ring is Noetherian”.

Radicals of rings

Nilradicals of rings

Let R be a commutative ring.

- The **nilradical** of R : $Nil(R) = \{x \in R : \exists n[x^n = 0_R]\}$.
- Classically, $Nil(R)$ = the intersection of all prime ideals of R , also known as the **prime radical** of R

Theorem

- Downey, Lempp, Mileti (2007): There is a computable commutative ring R such that $Nil(R) = \{x \in R : \exists n[x^n = 0_R]\}$ is Σ_1^0 -complete.
- Conidis (2009): There is a computable **noncommutative** ring R such that the prime radical of it is Π_1^1 -complete.

Jacobson radicals of commutative rings

Let R be a commutative ring.

- The **Jacobson radical** of R :

$$\text{Jac}(R) = \{x \in R : \forall y \in R \exists z \in R [z(1_R - yx) = 1_R]\}.$$

- Classically, $\text{Jac}(R)$ = the intersection of all maximal ideals of R .

Theorem(Downey, Lempp, Mileti, 2007)

There exists a computable ring R such that

$\text{Jac}(R) = \{x \in R : \forall y \in R \exists z \in R [z(1_R - yx) = 1_R]\}$ is Π_2^0 -complete.

A natural question:

- What is the complexity of Jacobson radicals of *noncommutative* rings?

Jacobson radicals of noncommutative rings

For a ring R not necessarily commutative, we propose the following notions.

- The **first order left Jacobson radical** of R :

$$Jac_l^0(R) = \{x \in R : \forall y \in R \exists z \in R [z(1_R - yx) = 1_R]\}.$$

- The **first order right Jacobson radical** of R :

$$Jac_r^0(R) = \{x \in R : \forall y \in R \exists z \in R [(1_R - xy)z = 1_R]\}.$$

- The **second order left Jacobson radical** of R :

$$Jac_l^1(R) = \bigcap \{\mathfrak{M} : \mathfrak{M} \text{ is a maximal left ideal of } R\}.$$

- The **second order right Jacobson radical** of R :

$$Jac_r^1(R) = \bigcap \{\mathfrak{M} : \mathfrak{M} \text{ is a maximal right ideal of } R\}.$$

First order Jacobson radicals

Proposition(Wu, 2021)

Over RCA_0 , the following nine sets are equal for a ring R .

$$A_1 := \{x \in R : \forall y_1, y_2 \in R \exists z \in R [z(1_R - y_1xy_2) = (1_R - y_1xy_2)z = 1_R]\}.$$

$$A_2 := \{x \in R : \forall y_1, y_2 \in R \exists z \in R [z(1_R - y_1xy_2) = 1_R]\}$$

$$A_3 := \{x \in R : \forall y_1, y_2 \in R \exists z \in R [(1_R - y_1xy_2)z = 1_R]\}$$

$$A_4 := \{x \in R : \forall y \in R \exists z \in R [z(1_R - yx) = (1_R - yx)z = 1_R]\}$$

$$A_5 := \{x \in R : \forall y \in R \exists z \in R [z(1_R - yx) = 1_R]\} = \text{Jac}_l^0(R)$$

$$A_6 := \{x \in R : \forall y \in R \exists z \in R [(1_R - yx)z = 1_R]\}$$

$$A_7 := \{x \in R : \forall y \in R \exists z \in R [z(1_R - xy) = (1_R - xy)z = 1_R]\}$$

$$A_8 := \{x \in R : \forall y \in R \exists z \in R [z(1_R - xy) = 1_R]\}$$

$$A_9 := \{x \in R : \forall y \in R \exists z \in R [(1_R - xy)z = 1_R]\} = \text{Jac}_r^0(R)$$

Corollary

Over RCA_0 , $\text{Jac}_l^0(R) = \text{Jac}_r^0(R)$.

In the following, $\text{Jac}^0(R) = \text{Jac}_l^0(R) = \text{Jac}_r^0(R)$ means the first order radical of R .

Theorem(Sato, 2016)

The following are equivalent over RCA_0 .

- (1) ACA_0 .
- (2) For any ring R , $\text{Jac}^0(R) = \text{Jac}_l^1(R)$.
- (3) For any ring R , $\text{Jac}^0(R) = \text{Jac}_r^1(R)$.

Corollary

For any ring R , ACA_0 can prove $\text{Jac}_l^1(R) = \text{Jac}_r^1(R)$.

Second order Jacobson radicals

Motivating question

Can RCA_0 prove $\text{Jac}_l^1(R) = \text{Jac}_r^1(R)$ for a noncommutative ring R ?

- For general rings, the question is unknown currently!

Definition(RCA_0)

- A ring R is **local** if the set $U(R)$ of invertible elements exists and $R - U(R)$ is closed under addition.
- A ring R is **left local** if the set $U_l(R)$ of left invertible elements exists and $R - U_l(R)$ is closed under addition.
- A ring R is **right local** if the set $U_r(R)$ of right invertible elements exists and $R - U_r(R)$ is closed under addition.

Lemma

Over RCA_0 , the following are equivalent for a ring R .

- (1) R is left local.
- (2) $\text{Jac}_l^1(R)$ exists and $\text{Jac}_l^1(R) = R - U_l(R)$.

Similar for right local rings.

Theorem(Wu, 2021)

Over RCA_0 , for a left local ring R , $\text{Jac}_l^1(R) = \text{Jac}_r^1(R)$.

Corollary

The following are equivalent over RCA_0 .

- (1) R is a left local ring.
- (2) R is a right local ring.
- (3) R is a local ring.

Proposition(ACA₀)

For a ring R , the first order Jacobson radical $Jac^0(R)$ is equal to each of the following sets.

- $B_1 :=$ the intersection of all maximal left ideals of $R = Jac^1_l(R)$.
- $B_2 :=$ the intersection of the annihilators of all simple left R -modules.
- $B_3 :=$ the largest superfluous left ideal of R .
- $B_4 :=$ the sum of all superfluous left ideals of R .
- $B_5 :=$ the intersection of all maximal right ideals of $R = Jac^1_r(R)$.
- $B_6 :=$ the intersection of the annihilators of all simple right R -modules.
- $B_7 :=$ the largest superfluous right ideal of R .
- $B_8 :=$ the sum of all superfluous right ideals of R .

Radicals of modules

Definition

Let R be a commutative ring with identity 1_R , a **module** M over R is an abelian group together with a scalar operation \cdot from $R \times M$ to M such that for all $m, m_1, m_2 \in M$ and $r, r_1, r_2 \in R$, the following axioms hold:

- $(r_1 + r_2) \cdot m = r_1 \cdot m + r_2 \cdot m$;
- $(r_1 r_2) \cdot m = r_1 \cdot (r_2 \cdot m)$;
- $1_R \cdot m = m$;
- $r \cdot (m_1 + m_2) = r \cdot m_1 + r \cdot m_2$.

We often write $r \cdot m$ as rm for convenience.

Examples:

- Modules over the integer ring \mathbb{Z} are abelian groups.
- Modules over fields are vector spaces.

In this section, let R be a commutative ring.

Definition

For an R -module M , the **radical** of M $rad(M)$ is the intersection of all maximal submodules of M .

- Classically, $rad(M) = \bigcap \{ \mathfrak{M}M : \mathfrak{M} \text{ is a maximal ideal of } R \}$.

Question: What is the complexity of radicals of modules over commutative rings?

- For \mathbb{Z} -modules M , $rad(M) = \bigcap_{i \in \mathbb{N}} p_i M$ is Π_2^0 , where p_i is the i -th prime number, and $p_i M = \{p_i x : x \in M\}$.

Theorem(Wu, 2020)

The following are equivalent over RCA_0 .

- (1) ACA_0 .
- (2) For any \mathbb{Z} -module M , $rad(M)$ exists.

Theorem(Wu, 2021)

There is a computable \mathbb{Z} -module M such that $rad(M)$ is Π_2^0 -complete.

Theorem(Conidis, 2021)

There is a computable module M over a computable ring R such that $\text{rad}(M)$ is Π_1^1 -complete.

Corollary

The following are equivalent over RCA_0 .

- (1) $\Pi_1^1\text{-CA}_0$.
- (2) For any module M over a commutative ring R , $\text{rad}(M)$ exists.

Thank you!
